Project Name	Credit Card Approval Prediction
Maximum Marks	5 Marks

Coding & Solution

This section evaluates the implementation quality of the Credit Card Approval Prediction project. The project is developed using Machine Learning and Flask to automate the credit card approval process. The code is modular, well-documented, follows Python coding standards, and satisfies the functional requirements of the system.

Solution Summary

Field	Details
Repository Link / URL	https://github.com/Archana0212/Credit-Card-Approval-Prediction
Programming Language(s)	HTML,CSS,Python,Javascript(basics)
Framework(s) Used	Flask, Scikit-learn, Pandas, NumPy, Joblib,Gunicorn
Key Features Implemented	• User-friendly web interface for entering applicant details. • Credit card approval prediction using a Logistic Regression model. • Displays prediction result (Approved/Rejected). • Shows prediction confidence score. • Provides a human-readable explanation for the prediction. • Input validation to improve data quality. • About Project page explaining the application.
Pending / Incomplete Features	Pending Features: Improved input validation, enhanced prediction explanations, user authentication, support for additional ML models, analytics dashboard, and database integration.
Setup / Run Instructions	Clone the GitHub repository and navigate to the project directory. Install all the required dependencies using the pip install -r requirements.txt command. After the installation is complete, run the Flask application using the python app.py command. Once the server starts successfully, open a web browser and visit http://127.0.0.1:5000 to access the application. Alternatively, the application can be accessed through the deployed Render demo link.

Code Quality Checklist

S.No	Criteria	Status(yes/no)
1	Code is modular and organized into functions / classes	Yes
2	Meaningful variable and function names are used	Yes
3	Code includes comments / documentation where necessary	Yes
4	Error handling is implemented for critical operations	Yes
5	The application runs without critical errors	Yes
6	Code is committed to a version control repository	Yes

Additional Notes / Comments

The project follows good coding practices by organizing the code into modular functions with meaningful variable and function names. Comments have been included where necessary to improve readability and maintainability. Basic error handling has been implemented for critical operations such as model loading and user input processing. The application runs successfully after deployment, and the complete source code is maintained in a GitHub repository using version control.
